

TROUBLESHOOTING FOR SHEETFED AND WEB PRESSES

## GLAZING OF ROLLERS

### CAUSES

1. This is caused by many different things including ink residue left in the rollers, gum and residue chemistry picked up from the plates, calcium, etc. picked up from the surface of stock, by-products from the fountain solution, and so on.

### REMEDIES

1. The best way to combat this is with regular treatment (recommended weekly) of the rollers with a good deglazer such as **Uni OD Deglazer**. Assure that the form rollers are shimmed or locked properly to prevent sideways movement.
